

Revolutionizing Quality Inspections Across the Perishables Supply Chain

Maintain your quality standards. Protect your brand.
Protect your bottom line.

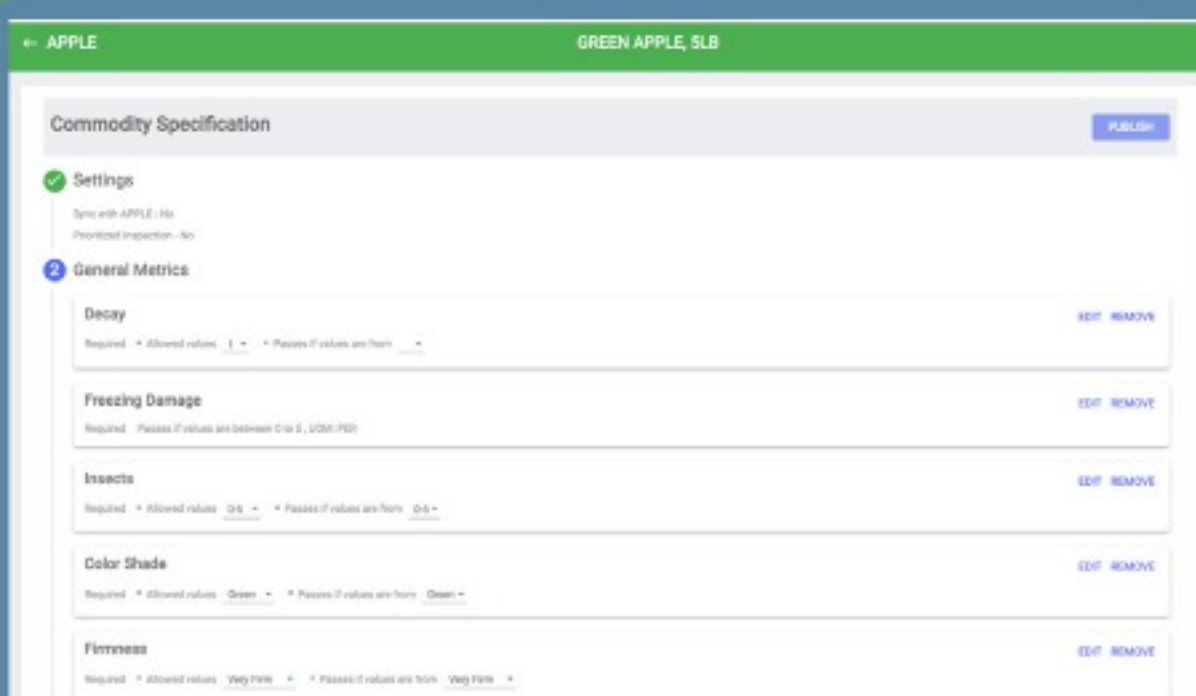

iTradefresh brings unmatched sophistication and flexibility to perishable commodity inspections – guiding inspection processes, automating notifications, providing clear issue and vendor insights, and helping buyers source and procure the best product available on the market. We are well past the days of clipboards and ‘smart’ excel forms to perform and record inspections. Using iTradefresh, an inspector can cut commodity inspection time by 50% and reduce the amount of time handling rejections, including all documentation, photos, and notifications, by 20%.

iTradefresh also gives procurement managers, inspection managers, and other stakeholders crucial visibility into what is occurring at each inspection facility, including immediate notifications about discrepancies, product rejections, and related exceptions. Additionally, vendor relationships also benefit from objective quality analyses backed up by published tolerances, corroborating photos, temperature data, and more.

Establishing standard perishables inspection practices across an organization increases product quality, boosts customer satisfaction, and sets crystal clear expectations with suppliers. Only with the ability to analyze the outcomes of those practices are their benefits truly realized: reducing cost and eliminating waste from the perishables supply chain, informing procurement and sourcing decisions, understanding trends, and resolving perishable quality issues before they potentially reach the consumer. iTradefresh sets a new standard in each of these areas.

QUICKLY IDENTIFY QUALITY GAPS

- Automate inspection processes and guide inspectors on exactly what, where, when, and how to inspect.
- Standardize inspection processes between different facilities, inspectors, or even shifts – everyone uses the same specification
- Conduct a more rigorous inspection in less time than it takes to perform a semi-manual inspection

INSPECT AT HIGH SPEED

- Inspect on a tablet, phone or via a web portal; no dependencies on a carted laptop or a loose digital camera
- Capture photos and notes within the application to include in reports
- Minimize the time 'waiting on QC' to finish before put-away

REDUCE LOSSES

- Track lots separately when taking samples to report and assess them individually. Only reject bad lots
- Inspect product in the field before it gets on a truck. Procure the best product available between multiple vendors, facilities, or growing regions
- Automatically generate meticulous rejection reports with photos, notes, samples, etc. that can be shared with vendors

RESOLVE ISSUES IN SECONDS, NOT MINUTES

- Immediately notify management of any exceptions when inspecting trailers or products
- Assess suppliers against similar vendors based on at least 11 different information categories
